Useful Stuff

Completing the square

$$ax^{2} + bx + c = 0$$

$$a(x+d)^{2} + e = 0$$

$$d = \frac{b}{2a}$$

$$e = c - \frac{b^{2}}{4a}$$

Trig Functions

$$\begin{split} \sin^2(x) &= \frac{1-\cos(2x)}{2} \\ \cos^2(x) &= \frac{1+\cos(2x)}{2} \\ \frac{d}{dx} \tan(x) &= \sec^2(x) \\ \frac{d}{dx} \sec(x) &= \sec(x) \tan(x) \\ \frac{d}{dx} \tan^{-1}(x) &= \frac{1}{1+x^2} \\ \int \sec(x) &= \ln|\sec(x) + \tan(x)| \end{split}$$

Area & Volume

Volume by slicing A(x) = area of crosssection at x,

$$V(S) = \int_a^b A(x)dx$$

Volume by disk If f(x) rotated around x-axis,

$$V(S) = \int_a^b \pi[f(x)]^2 dx$$

Volume by cylindrical shells If f(x) Hyperbolic Functions rotated around y-axis,

$$V(S) = \int_{a}^{b} (2\pi x f(x)) dx$$

Applications

Arc Length
$$\int_a^b \sqrt{1 + [f'(x)]^2} dx$$

Note use of derivative!

Surface Area of Revolution Revolve f(x) around x axis,

$$SA(x) = \int_{a}^{b} (2\pi f(x)\sqrt{1 + [f'(x)]^2})dx$$

Mass-density for 1-d object If p(x)linear density for given x,

$$m = \int_a^b p(x)dx$$

Mass-density for circular object If p(x) radial density for given x, and radius = r, $m = \int_0^r 2\pi x p(x) dx$

Work done If
$$F(X)$$
 = force at point x,

$$W = \int_a^b F(x) dx$$

*Recall constant force yields F * d

| f(x) | $\frac{d}{dx}f(x)$ |
|---------|--------------------|
| sinh(x) | cosh(x) |
| cosh(x) | sinh(x) |
| tanh(x) | $sec^2(x)$ |
| coth(x) | $-csch^2(x)$ |
| sech(x) | -sech(x)tanh(x) |
| csch(x) | -csch(x)coth(x) |

Integration Techniques

Int by parts $\int u dv = uv - \int v du$ Pick u using LIATE (log, inv trig, alg, trig, exp)

$$\int cos^j(x) sin^k(x) dx$$

If k odd keep 1 sin(x), convert rest using $\sin^2 x = 1 - \cos^2 x$. u-sub with $u = \cos(x)$.

If j odd keep 1 cos(x), convert rest using $\cos^2 x = 1 - \sin^2 x$. u-sub with $u = \sin(x)$.

If both even use $sin^2x = \frac{1-cos(2x)}{2}$

$$\int tan^k(x)sec^j(x)dx$$

If j even and ≥ 2 keep $sec^2(x)$, convert rest using $sec^2x = tan^2x + 1$. u-sub with u = tanx.

If k odd, $j \ge 1$ keep sec(x)tan(x), convert rest using $tan^2x = sec^2x$. u-sub with u = secx.

If k odd, $k \ge 3$ and j = 0 turn one tan^2x into sec^2x-1 . Repeat process. If k even, j odd, use $tan^2x = sec^2x - 1$ to turn $tan^k x$ to sec x.

Reductions

$$\begin{split} &\int sec^n x dx = \\ &\frac{1}{n-1} sec^{n-2} x tanx + \frac{n-2}{n-1} \int sec^{n-2} x dx \\ &\int tan^n x dx = \frac{1}{n-1} tan^{n-1} x - \int tan^{n-2} x dx \end{split}$$

Trig subs Don't forget to change dx to $d\theta$ $a^2 - x^2$ Use $x = asin\theta$ $a^2 + x^2$ Use $x = atan\theta$ $x^2 - a^2$ Use $x = asec\theta$

Arclength ax^2

$$\frac{x\sqrt{1+4a^2x^2}}{\text{Note: if evaluating over interval [a,b], if a=0,}} \frac{1}{4a}$$
